

1. (table shows averages)

	gini	entropy
10	0.947259742276044	0.9525850023288308
25	0.9596180717279925	0.956078248719143
50	0.9631268436578171	0.9631113181183046

4.1)  $2 \text{ km/h} = \frac{60 \text{ min/h}}{2 \text{ km/h}} = 30 \frac{\text{min}}{\text{km}} \rightarrow \text{rocky terrain}$

$3 \text{ km/h} = \frac{60 \text{ min/h}}{3 \text{ km/h}} = 20 \frac{\text{min}}{\text{km}} \rightarrow \text{sandy terrain}$

$5 \text{ km/h} = \frac{60 \text{ min/h}}{5 \text{ km/h}} = 12 \frac{\text{min}}{\text{km}} \rightarrow \text{smooth terrain}$

Utility (R1) =  $(0.2 \times 20 + 0.3 \times 12 + 0.5 \times 30) = 22.6 \text{ min/km} \times 5 \text{ km} = 113 \text{ min}$  ↗ x5

Utility (R2) =  $(0.4 \times 20 + 0.2 \times 12 + 0.4 \times 30) = 22.4 \text{ min/km} \times 7 \text{ km} = 156.8 \text{ min}$  ↗ x7

Utility (R3) =  $(0.5 \times 20 + 0.4 \times 12 + 0.1 \times 30) = 17.8 \text{ min/km} \times 6 \text{ km} = 106.8 \text{ min}$  ↖ x6

Route 3 is the best one.

4.2) Route 1 adjustment =  $0.7 \times (-20) + 0.3 \times 15 = -9.5 \text{ minutes}$   
 $113 - 9.5 = 103.5 \text{ minutes}$

Route 3 adjustment =  $0.6 \times 40 = 24 \text{ minutes}$

$106.8 + 24 = 130.8 \text{ minutes}$ . Route 1 is now the best one.

4.3) If it's not rocky anymore, we have to change the probabilities.

$P(\text{sandy}) = \frac{0.4}{0.4 + 0.2} = 0.67$  ↗ x7  
 $P(\text{smooth}) = 1 - 0.67 = 0.33$

New Utility (R2) =  $(0.67 \times 20 + 0.33 \times 12) = 16.2 \text{ min/km} \times 7 \text{ km} = 121.3 \text{ min}$

4.4) The probability the satellite will tell us this is 0.6, because that's the complement of the probability that it is rocky.

4.5) If it is rocky  $\rightarrow 1 \times 30 = 30 \text{ min/km} \times 7 \text{ km} = 210 \text{ min}$ .

4.6) Even with the new utility, Route 1 is still better. Therefore, it is best to take it without waiting for the satellite.
